  - Informational
    - \* [-1] The `PasswordStore::getPassword` natspec indicates a parameter that doesn't exist, causing the natspec to be incorrect

Protocol Summary

PasswordStore is a protocol dedicated to storage and retrieval of a user’s passwords. The protocol is designed to be used by a single user, and is not designed to be used by multiple users. Only the owner should be able to set and access this password.

Disclaimer

The auditing team makes all effort to find as many vulnerabilities in the code in the given time period, but holds no responsibilities for the findings provided in this document. A security audit by the team is not an endorsement of the underlying business or product. The audit was time-boxed and the review of the code was solely on the security aspects of the Solidity implementation of the contracts.

Risk Classification

		Impact		
		High	Medium	Low
Likelihood	High	H	H/M	M
	Medium	H/M	M	M/L
	Low	M	M/L	L

We use the CodeHawks severity matrix to determine severity. See the documentation for more details.

Audit Details

The findings described in this document correspond to the following commit hash:

1 308aa5b3083f582747d660a385dcb48ecbcf1dfb

Scope

```
1 ./src/  
2 #-- PasswordStore.sol
```

## Roles

- Owner: The user who can set the password and read the password.
- Outsiders: No one else should be able to set or read the password.

## Executive Summary

We spent 10 hours with one auditor and found 2 critical bugs.

## Issues found

Severity	Number of issues found
High	2
Medium	0
Low	0
Info	1
Total	3

## Findings

### High

#### [H-1] Storing the password on-chain makes it visible to anyone, and no longer private

**Description:** All data stored on-chain is visible to anyone, and can be read directly from the blockchain. The 'PasswordStore:s\_password' variable is intended to be a private variable and only accessed through the getPassword function, which is intended to be only called by the owner of the contract.

We show one such a method of reading any data off chain below.

**Impact:** Anyone can read the private password, severely breaking the functionality of the protocol.

```
3     s_password = newPassword;  
4     emit SetNetPassword();  
5 }
```

**Impact:** Anyone can set/change the password of the contract, severely breaking the contract intended functionality.

**Proof of Concept:** Add the following to the `PasswordStore.t.sol` test file.

Code

```
1     function test_anyone_can_set_password(address randomAddress) public  
2     {  
3         vm.assume(randomAddress != owner);  
4         vm.prank(randomAddress);  
5         string memory expectedPassword = "myNewPassword";  
6         passwordStore.setPassword(expectedPassword);  
7  
8         vm.prank(owner);  
9         string memory actualPassword = passwordStore.getPassword();  
10        assertEq(actualPassword, expectedPassword);  
11    }
```

**Recommended Mitigation:** Add and access control conditional to the `setPassword` function.

```
1     if(msg.sender != s_owner){  
2         revert PasswordStore_NotOwner();  
3     }
```

## Informational

**[-1] The PasswordStore::getPassword natspec indicates a parameter that doesn't exist, causing the natspec to be incorrect**

### Description:

```
1     /*  
2     * @notice This allows only the owner to retrieve the password.  
3     @> * @param newPassword The new password to set.  
4     */  
5     function getPassword() external view returns (string memory) {
```

The `PasswordStore::getPassword` function signature is `getPassword()` which the natspec says it should be `getPassword(string)`.

**Impact:** The natspec is incorrect.

**Recommended Mitigation:** Remove the incorrect natspec line.

1 - \* @param newPassword The **new** password to set.
